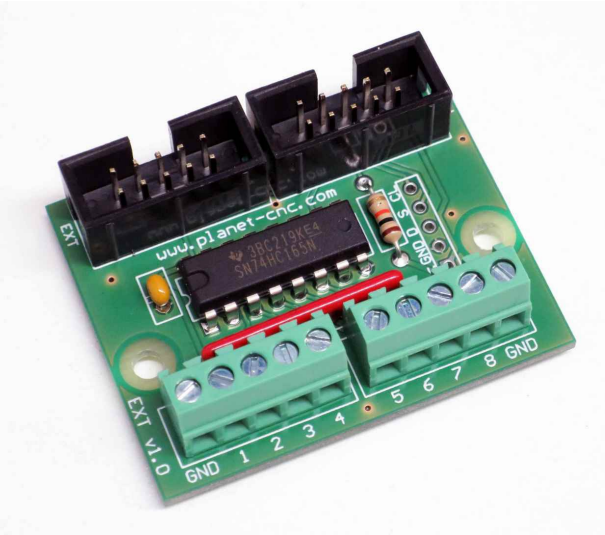
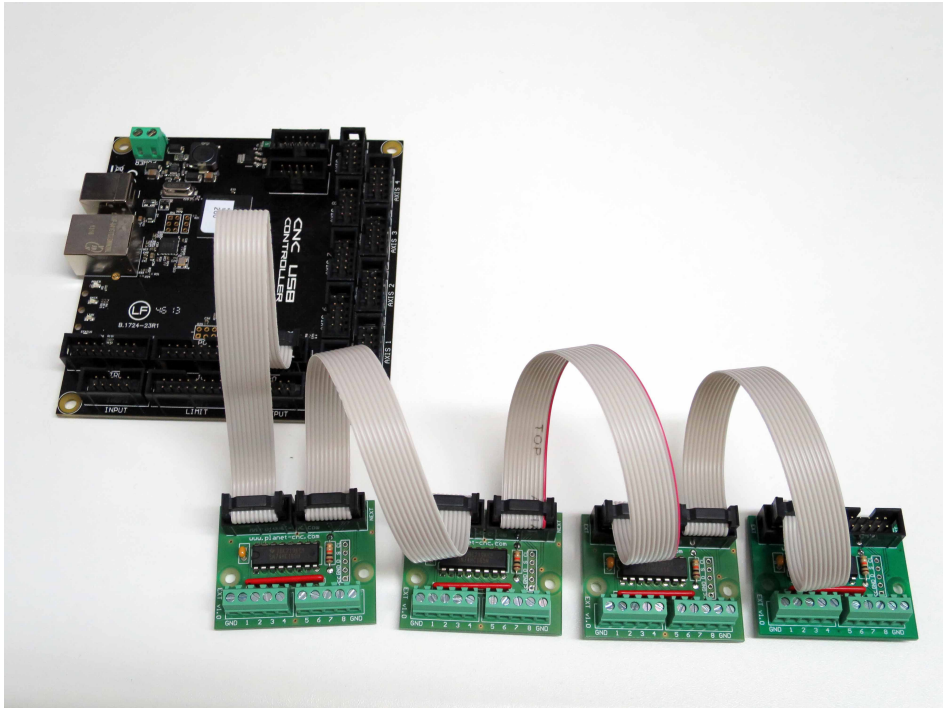
Using ExtIn board with Mk3 controller

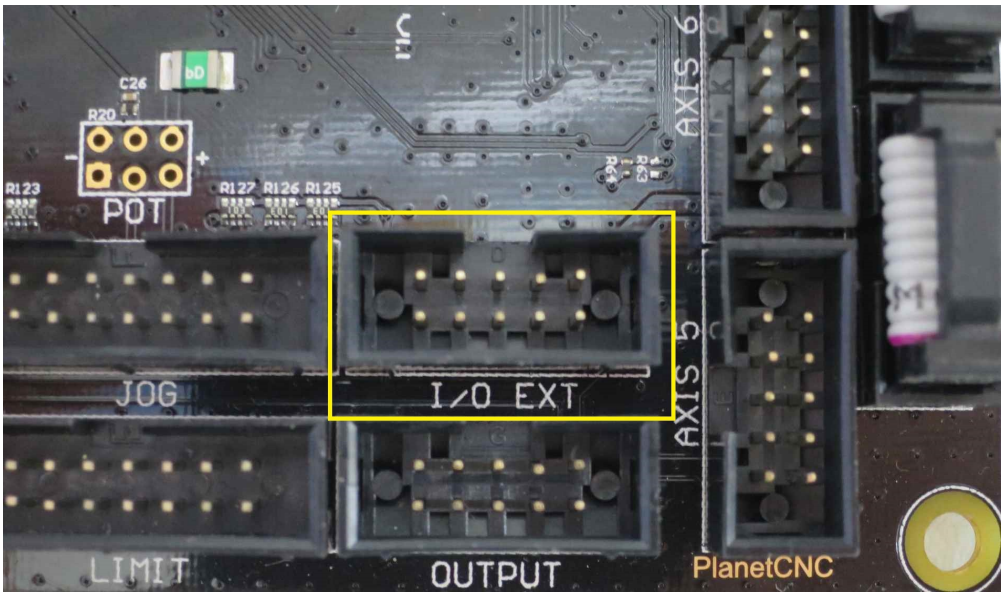


Each ExtIn board increases the number of inputs of controller for 8 inputs.

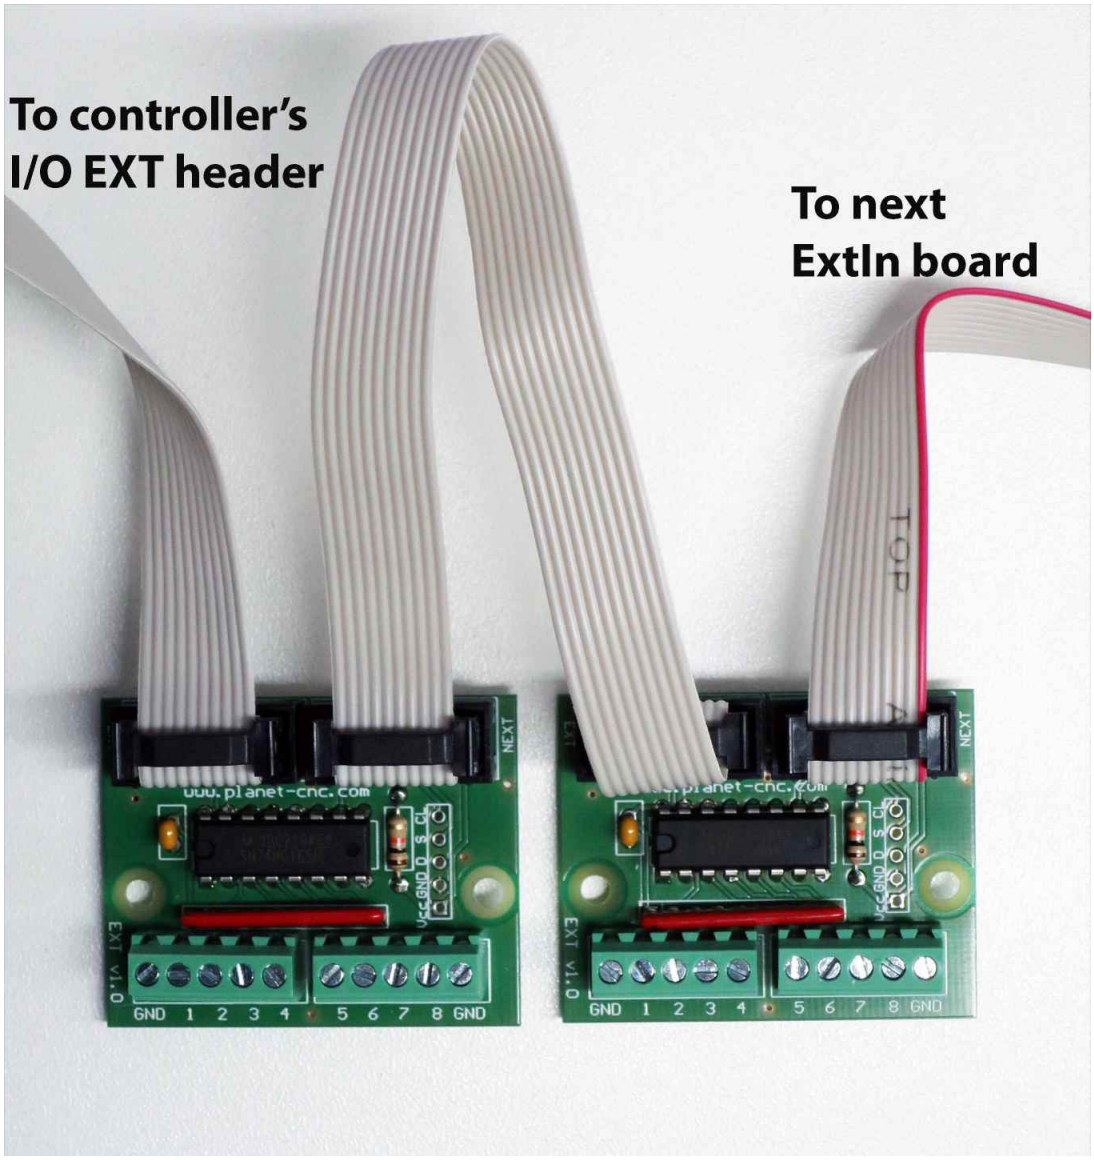
You can connect ExtIn boards in series to achieve higher number of inputs.
For example, 4 ExtIn boards connected in series, will give you a total of 32 inputs.

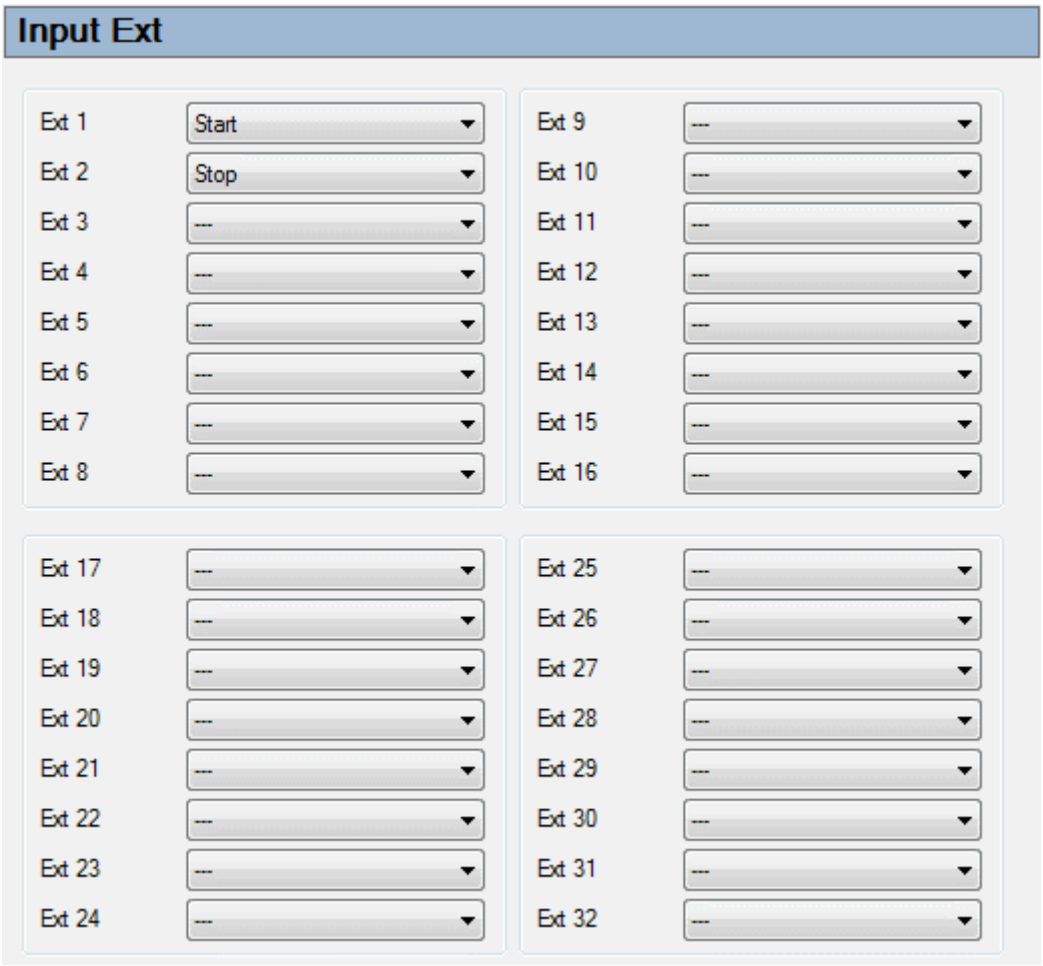


ExtIn board is connected to controller trough I/O EXT connector.



Each new board can be added to “chain” trough NEXT connector located on the board.





All additional inputs can be assigned in *'Settings/Input/Input Ext'.*
